

Privacy Policy

Introduction

Autism-Language-Therapies operates SentenceWeaver (the "Service"), a Software as a Service (SAAS), educational application designed to help children with autism learn grammar.

Personal information we collect

No PII is collected on the platform. The information collected is an encrypted userid. That userid is associated with a grammar exercise, where the data passed is a datetime, the grammar response, the recorded answer, and the lesson step. No other data is collected.

How we collect information

When the user uses the enter key, this information is stored in a secure database in the cloud. No other information is collected or stored.

Special provisions for children

No special provision is made for children, as no personal identifiable information is collected. No email is collected. The userid is a custom userid created by the parent of the child separate from the software. No COPPA compliance is required given that no private information is collected.

Data Usage and Storage

This data - a userid, a datetime, the grammar response, the recorded answer, and the lesson step – are stored in an encrypted, MySQL database that is monitored for threats.

Data security measures

The user has a one-time link sent to their email address that they enter into an online form in order to create an account. The account information - userid and password - are stored separately from the SentenceWeaver software, and the software makes a secure API call to the encrypted security login storage and password protected login into the software.

Data retention policies

This data retention policy establishes guidelines for maintaining and disposing of company data to ensure compliance with legal requirements, protect sensitive information, and manage storage efficiently. Only usage data is stored. Data is not deleted between sessions.
